✓ Absorption in aluminum of the positron radiation of nitrogen<sup>14</sup>. T. Grabowski and L. Nilsson. Bull. Acad. polon. sci. Cl. sci. phys. math. 1959-8(1964). <sup>14N</sup> was produced in the reaction  $C^{14}(d, p)^{14N}$ . The positrons produced from <sup>14N</sup> were then intercepted by Al plates placed in front of the Geiger-Muller counter. The av. thickness of the plates was 0.259 mm. and the source to counter window distance was 100 mm. A plot is shown of the log of the no. of counts vs. absorber thickness. It shows 2 sections, a rectilinear downward sloping section and a horizontal section. The value of the absorption coeff. as computed from the measurements is  $\mu = 10.6 + 0.3$  sq. cm./g. and the practical range is  $R = 0.47 + 0.01$  g./sq. cm. The max energy of the spectrum was found to be 1.186 eV. K. R. Hesse

Grabowski W. Superfinishing and Its Application in the Motor Industry.  
"Działanie i jego zastosowanie w przemyśle samochodowym"  
Technika Motoryzacyjna No. 6, 1953, pp. 105-170, 11 figs. 4 tabs.

The principles of, procedure in and advantages according to the motor industry from oscillatory superfinishing. The author describes the types and design of machine tools in use (universal, special crankshaft and centreless grinding machines), and types of essential instruments for superfinishing on rail-grinding machines and lathes. He lays stress on the importance of superfinishing as one of the means of improving quality in the motor industry, and recommends what instruments be used in ordinary lathes available in every repair shop and automobile works.

Grabowski, W. The Cooling Problem in Grinding Processes

"Chłodzenie w obróbce szlifowaniem". Mechanik. No. 8, 1934, pp. 290-295, 10 figs.

Cooling in grinding processes serves the following purposes: the heat generated on the surface of an object being machined is rapidly conducted. The friction force between the abrasive grains of the grinder and the object is diminished. Chips are more easily separated. Clogging of pores in the grinder is avoided. Consideration was given to the advantages and drawbacks of the following grinding methods: dry grinding in free air or in a stream of compressed air; grinding while cooling with pure water; cooling with water mixed with anti-corrosion substances; cooling with oil; emulsions; cooling with mineral oils. New developments in grinder cooling processes are also described, as for example: a cooling process with the coolant being supplied through a grinder, and cooling performed simultaneously with two different coolants.

Grabowski, W. Dressing Grindstones. Vol. 1-7

"Obiegowe Słownictwo Mechaniki, No. 1, 1854, pp. 12-17, 15 figs, 1 tab. Dressing tools and dressing methods are reviewed. Special attention is paid to the possibilities of replacing expensive diamond tools with dressers containing no diamonds. Dressing of grinders with the aid of diamond and metal tools, are discussed, as well as with tools made of abrasive materials or of hard metal carbides. When hard metal carbide tools are used, grinders are dressed by rubbing and crushing.

Experimental demonstration of the hydroxyl-ion formation during the polarographic reduction of oxygen. W. Klemula and Z. R. Grabowski (Warsaw Univ.), Collection Československ. Chem. Commun., 15, 1085-90 (1960) (in English).—In neutral or weakly acid solns. contg. phenolphthalein, a pink color due to the formation of OH<sup>-</sup> appears around the dropping electrode at potentials at which O is

reduced. Similar phenomena occur during the reduction of HgO<sub>2</sub>, NO<sub>3</sub><sup>-</sup>, BrO<sub>3</sub><sup>-</sup>, and some org. compds. When Cd<sup>2+</sup> or La<sup>3+</sup> solns. contg. O were electrolyzed, a ppt. of the metal hydroxide appeared as a "collar" on the tip of the capillary around the drop. Louis Meites
